

EXPERIMENTO DE SUMAS ENTRE DISTINTOS TIPOS DE DATOS

1. **string + string** → Conecta los textos en una sola cadena.
2. **string + int** → Arroja **TypeError** (no se pueden sumar directamente).
3. **int + string** → Arroja **TypeError** (el orden no cambia la incompatibilidad).
4. **list + list** → **Combina** todos los elementos en una sola lista.
5. **string + list** → Arroja **TypeError** (no se puede concatenar texto con una lista).
6. **float + int** → Realiza la suma matemática y devuelve un **float**.
7. **bool + bool** → Realiza una suma matemática tratando True como 1 y False como 0 (da 1).

The screenshot shows a VS Code editor with a Python file named `number_of_labrador_retriever.py`. The code demonstrates various data type operations and their results:

```
1 # 1. string + string
2 breed_one = "labrador"
3 breed_two = "retriever"
4 result_1 = breed_one + breed_two
5 print(result_1) # Imprime: labradorretriever
6
7 # 2 y 3. string + int / int + string
8 # print("Tengo " + 30) # Arroja TypeError
9
10 # 4. list + list
11 small_dogs = ["poodles", "dachshund"]
12 big_dogs = ["labrador", "beagle"]
13 result_4 = small_dogs + big_dogs
14 print(result_4) # Imprime: ['poodles', 'dachshund', 'labrador', 'beagle']
15
16 # 6. float + int
17 dog_weight = 12.5
18 number_of_beagle = 25
19 result_6 = dog_weight + number_of_beagle
20 print(result_6) # Imprime: 37.5
21
22 # 7. bool + bool
23 is_dog = True
24 is_cat = False
25 result_7 = is_dog + is_cat
26 print(result_7) # Imprime: 1
```

The terminal output shows the execution of the script, confirming the results of the operations:

```
mariaalejandra@Air-de-Maria ~ % cd /Users/mariaalejandra ; /usr/bin/env /usr/local/bin/python3 /Users/mariaalejandra/.vscode/extensions/ms-python.debugpy-2026.6.0-darwin-arm64/bundled/lib/debugpy/launcher 58381 -- /Users/mariaalejandra/number_of_labrador_retriever.py
labradorretriever
37.5
1
```
